

## **Abstract**

„Digital dentistry in motion“

Common challenges such as excessive occlusal adjustments and all-ceramic failures are a result of inaccurate clinical records.

Motion data is the ultimate missing link for a seamless digital workflow. Precise 4D-recordings for creating a vivid digital avatar of our patients empower us to better understand and plan our treatments. The result is an enhanced clinical performance with an increased predictability of outcome and a highly efficient workflow.

With 4 years of experience in thousands of motion data scans, we highlight the clinical relevance for both function and esthetics.
